INTRODUCTION

Education is the process of developing the capacities and potentials of the individual so as to prepare that individual to be successful in a specific society or culture. From this perspective, education is serving primarily as an individual development function. Education begins at birth and continues throughout life. It is constant and on-going. Schooling generally begins somewhere between the ages four and six when children are gathered together for the purposes of specific guidance related to skills and competences that society deems important. In the past, once the formal primary and secondary schooling was completed the process was finished. However, in today’s information age, adults are quite often learning in informal setting throughout their working lives and even into retirement. Education, in its broadest sense, may be defined as a process designed to inculcate the knowledge, skills and attitudes necessary to enable individuals to cope effectively with their environment. Its primary purpose is to foster and promote fullest individual self-realization for all people. Achieving these goals require understanding of commitment to the proposition that education is a primary instrument for social and economic advancement of human welfare (Verma, 1990).

The world is becoming more and more competitive. Quality of performance has become the key factor for personal progress. Parents desire that their children climb the ladder of performance to as high a level as possible. This desire for high level of achievement puts a lot of pressure on students, teachers and schools and in general the education system itself. In fact, it appears as if the whole system of education revolves around the academic achievement of students, though various other
outcomes are also expected from the system. Thus a lot of time and effort of the schools are used for helping students to achieve better in their scholastic endeavors. The importance of scholastic and academic achievement has raised important questions for educational researchers (Nuthnap, 2007).

As an individual grows and develops, he learns, not only about the world but about himself and his place in it. Each person lives with himself and hence, to some degree is always alone. No one can ever completely know the self-better than anyone else, although in the pursuit for understanding oneself and others there has developed much of human thought and philosophy, including psychology. Man has a long held in the hope of answering such question as: who am I? How did I come to be this way? And their logical consequence, the search for purpose; why am I? (Nadalmani, 2001). The psychological construct, self-concept is essentially private even though it is in part translated into action by beliefs we express. Sidhu (1987) defined self-concept as those perceptions, beliefs, feelings, attitudes, and values which the individual used in on describing him/herself. Personality is not a specific quality of a person’s but a quality of his/her behaviour. How he/she behave depend upon how he/she feels about him/herself, about other people and about his/her relationship with them. These feelings make up his/her self-concept what him/her thing about him/herself as a person. A person’s self-concept is the fundamental core of his entire personality and determines the quality of behaviour.

It can be predicted that, poor self-concept, implying lack of confidence in facing and mastering the school environment, in fact, the self-concept does appear to be related to school adjustment. Substantial evidence indicates that children and adult with poor self-concept when compared with those who have high self-concept are more anxious and less adjusted generally and less popular. The pattern of parental rewards and punishments seems to affect the self-concept and quite certainly, the self-concept of bright but under achieving young stars are less positive than those of children who are doing well as can be expected in school. Incidentally children tend to mould their self-concept according to the way they think their teachers regarded them.

Tymms and libbon (1992) examines the relationship between time spent on homework and exam grades among approximately 3000 students from school and colleges in Northeast England. Average time spent was 5 hrs. per week. Girls reported spending approximately 30 minutes/week more than boys. The study revealed that students who marked for long hours gained slightly better than those who worked for modest periods. Suneetha and Mayuri (2001) conducted a study on age and gender differences on the factors affecting high academic achievement of school children. The total sample of the study comprised of 120 children of IX and X grade drawn purposively from 10 private schools of Hyderabad.

Malian’s intelligence scale for Indian children, patterns of study inventory, multi-dimensional assessment of personality inventory was used for data collection. The results showed boys and girls differed significantly in drilling, interaction, sets and language dimensions inventory. Manger and Elkland (2006) in their study of the effect of mathematics self-concept on girls’ and boys’ mathematical achievement found out that Norwegian elementary schoolboys showed significantly higher mathematics self-concept than girls. Boys also had a significantly higher mathematical achievement score than girls.

The problem of poor academic achievement is evidenced by the large number of students who come for repeating and carry over courses to the next level of the study. For instance, a study carried out by Pindar (1999) indicated that a total of 181 students out of the 338 final year NCE students of Kashim Ibrahim College of Education Maiduguri for 1993/1994 academic session could not graduate that session because they failed at least one course each. For the 1994/95 session, out of the 549 final year NCE students, 317 of them could not graduate because of the same problem. The problem of the Nigerian educational system is that students are not taught in a way that enhances creative thinking and assessment procedures do not reward creativity, this is a serious challenge to our educational system especially in the Colleges of Education.

Statement of Problem

The problem of poor academic performance of students at the tertiary level of education, and particularly among the Nigerian Certificate of Education (NCE) students is a matter of serious concern to all stakeholders in the society because a large numbers of NCE students proceed to next level with weak grades, carry over courses and even withdrawn from the college because of poor performance. In the end the NCE graduates will be employed to teach at the primary and junior secondary school levels of education. In addition if the NCE students are performing badly there is the possibility that those taught by these students will perform badly too. The quality of education provided in any society and the nature of change effected by education are both dependent on the quality of teachers and by the effectiveness of their teaching. The researchers have direct purposeful experience pertaining to the NCE student’s self-concept, the researchers have the impression that many students of Colleges of Education have come from low income earning families. They lack enough money to support themselves in attaining their physiological, social, emotional, and psychological needs. It implies therefore, some of them came to class without taking breakfast. Not all of them attend parties and other gathering for lack of dresses that they could use to attend

Objectives of the Study

The objective of the study is to determine if there is any relationship between:
1. Gender and self-concept of students in Colleges of Education in Borno State

Research Questions

The following research question is set in this study to find out if there is any:
1. Differences between gender and self-concept of students in Colleges of Education in Borno State

Research Hypotheses

The following null hypothesis is tested in this study:
H01: There is no significant difference between gender and self-concept of students in Colleges of Education in Borno State

RESULTS

Table 1 above presents the male and female student’s responses on self-concept. This is obvious from the value of scores which are shown by the mean and standard deviation of the students by gender. The obtained responses on students’ self-concept show the mean of 27.4255 and standard deviation of .97749, with N 322.

Hypotheses

H01: There is no significant difference between male and female students’ self-concept in College of Education in Borno State

Table 2 indicated the group statistics for self-concept and
gender on mean and statistics deviation in Borno State College of Education in Borno State. The Table indicated the t-test for self-concept and gender of students of Colleges of Education in Borno State. The result indicated that there is no significant difference between self-concept and gender of the students. Therefore; the null hypothesis was accepted.

DISCUSSION

In testing the hypothesis, which stated that there is no significant difference between male and female students' and self-concept in College of Education in Borno State, the null hypothesis was accepted. The results indicated that there is no significance difference between self-concept and Gender of students. The study disagreed with the study carried out by Morgan and Eluland (2006) who in their studies on effect of self-concept on girls and boys mathematics performance found that girls scored significant higher in Mathematics self-concept than boys.

The findings collaborate with the study carried out by Sidhu (1987) who reported that the importance of self-concept stems from its notable contribution to personality formation. Self-esteem has to do with social competence, since it influences how the person feels, how he/she thinks, learns, values him/herself, relates to others and ultimately, how he/she behaves. Since the relationship between patterns of study and self-concept of students of Colleges of Education in Borno State is significant with r .77;

The findings of this study also agrees with study carried out by Tymms and libbon (1992) who examines the relationship between time spent on homework and exam grades among approximately 3000 students from school and colleges in Northeast England. Average time spent was 5 hrs. per week. Girls reported spending approximately 30 minutes/week more than boys. The study revealed that students who marked for long hours gained slightly better than those who worked for modest periods.

Furthermore the findings of this study concur with the study of Suneetha and Mayuri (2001) who conducted a study on age and gender differences on the factors affecting high academic achievement of school children. The total sample of the study comprised of 120 children of IX and X grade drawn purposively from 10 private schools of Hyderabad. Malian's intelligence scale for Indian children, patterns of study inventory, multi-dimensional assessment of personality inventory was used for data collection. The results showed boys and girls differed significantly in drilling, interaction, sets and language dimensions inventory.

RECOMMENDATIONS AND COUNSELLING IMPLICATIONS

1- No significant difference between students’ gender and self-concept. Since the differences is positive, the college counsellor and the authority should promote the social needs of the students through organizing parties and providing common rooms and cafeteria facilities in the colleges and from time to time invite some comedians to display their talents to the students’ recreation. Physiological needs of students were found not encouraging because it ranked one of the least. If physiological needs are not available there is going to be total failure of college programme. This is because, it is the most important needs of living organism that is why Maslow placed it as the lowest needs and if it is absent nothing can be achieved inform of learning and self-concept (hungry man is angry man) if hunger is not quench no other needs could emerge that is why even safety can be risked to quench hunger
